

MICROBIOLOGICAL ENVIRONMENTS

USP <797> COMPLIANCE

MICROBIOLOGICAL ENVIRONMENTS has been designing and implementing Environmental Monitoring programs which are compliant with USP <1116> for medical device, pharmaceutical and biotechnology industries for the past ten years. MICROBIOLOGICAL ENVIRONMENTS offers the necessary microbiological services and the flexibility to support any pharmacy environmental monitoring program.

We are able to help you develop your entire <797> compliant environmental monitoring program or we can help with a particular aspect, such as:

- assisting with protocols
- designing a sample plan
- choosing equipment
- training personnel
- supplying equipment
- conducting analysis
- trending data
- setting alert and action levels
- effectively dealing with exceeded concern levels and contamination episodes.

The most cost effective solution for many of our clients is for us to ship all the necessary calibrated equipment and QC tested media to them; they conduct the sampling and return everything to MICROBIOLOGICAL ENVIRONMENTS for analysis and data management. However, if you prefer, we can send a technician onsite to conduct sampling of your compounding areas.

We will notify you immediately of any Exceeded Concern Levels, conduct any additional required testing and assist you with finding the cause or source of the contamination episode. With a commitment of one year, we will draft your baseline sample plan, perform quality control testing of media, analyze your data to set realistic alert and action levels and assist with drafting your routine environmental monitoring sample plan for no additional charge.
